

Project 2, Program Design

1. Write a C program that will calculate the voltage across the capacitor in the following circuit as time increases from 0 to 1 second in increments of 1/15 second, assuming that the switch is closed at time 0.

The voltage across the capacitor at time t is given by the following equation:

$$v(t) = V \times \left(1 - e^{-\frac{t}{\tau}}\right)$$

Constants: In this circuit, $V = 10$ volts, $R = 3,000$ ohms, and $C = 50 \times 10^{-6}$ farads. The circuit has a time constant τ , which depends on the resistance, R , and the capacitance, C , as $\tau = R \times C = 0.15$ second.

- 1) Name your program `voltage.c`
- 2) Use a for loop.
- 3) Use the math library function **`exp(x)`** to compute e^x . You will need to include the system header file `math.h`.
- 4) On Unix you will need **`-lm`** in your command line to tell the Linker to search the math library.
- 5) Use macro definition for all the constants.
- 6) Format the output so the output looks like the following. The time and voltage should display two digits after the decimal point.

time (sec)	voltage
0.00	0.00
0.07	3.59
0.13	5.89
0.20	7.36
0.27	8.31
0.33	8.92
0.40	9.31
0.47	9.55
0.53	9.71
0.60	9.82
0.67	9.88
0.73	9.92
0.80	9.95
0.87	9.97
0.93	9.98
1.00	9.99

2. You are creating a new account on a website and need to come up with a username. The username has the following requirement:
 - 1) The username has at least 5 characters, and at most 10 characters
 - 2) It must contain alphabetic letters (upper or lower case), digit or underscore, but no space or other punctuations.

For example, *mike_FL* is valid and *mike!FL* is invalid

Write a program that takes a word entered by the user, check if the word is a valid username. If the input is valid, print a confirmation statement. If it is not, print a statement that the input is not valid.

- 1) Name your program `username.c`.
- 2) The user input ends with the user pressing the enter key (a new line character).
- 3) Use `getchar()` to read in the input.
- 4) You can use character handling functions such as `isdigit` and `isalpha`. Don't forget to include `ctype.h` if you use any character handling functions.

Before you submit

1. Compile both programs with `-Wall`. `-Wall` shows the warnings by the compiler. Be sure it compiles on **student cluster** with no errors and no warnings.

```
gcc -Wall -lm voltage.c
```

```
gcc -Wall username.c
```

2. Be sure your Unix source file is read & write protected. Change Unix file permission on Unix:

```
chmod 600 voltage.c
```

```
chmod 600 username.c
```

3. Test the second program with the shell script on Unix:

```
chmod +x try_username
```

```
./try_username
```

4. Submit username.c and voltage.c on Canvas>Assignments>Project 2.

Grading

Total points: 100 (50 point each program)

1. A program that does not compile will result in a zero for that program.
2. Runtime error and compilation warning 5%
3. Commenting and style 15%
4. Functionality 80%

Programming Style Guidelines

The major purpose of programming style guidelines is to make programs easy to read and understand. Good programming style helps make it possible for a person knowledgeable in the application area to quickly read a program and understand how it works.

1. Your program should begin with a comment that briefly summarizes what it does. This comment should also include your **name**.
2. In most cases, a function should have a brief comment above its definition describing what it does. Other than that, comments should be written only *needed* in order for a reader to understand what is happening.

3. Variable names and function names should be sufficiently descriptive that a knowledgeable reader can easily understand what the variable means and what the function does. If this is not possible, comments should be added to make the meaning clear.
4. Use consistent indentation to emphasize block structure.
5. Full line comments inside function bodies should conform to the indentation of the code where they appear.
6. Macro definitions (`#define`) should be used for defining symbolic names for numeric constants. For example: `#define PI 3.141592`
7. Use names of moderate length for variables. Most names should be between 2 and 12 letters long.
8. Use either underscores or capitalization for compound names for variable: `tot_vol`, `total_volumn`, or `totalVolumn`.
